Exercise 1

The purpose of this exercise is just to evaluate technical skills and coding ability.

For this test you will need to build a spring boot application from scratch and use only spring or JAVA API to resolve it, no use of external libraries.

We need to store in the database a list of names:

```
var names =
["Jacob","Michael","Matthew","Joshua","Christopher","Nicholas","Andrew","Joseph","Daniel","Tyler","William","Brandon","Ryan","John","Zachary","David","Anthony","James","Justin","Alexander","Jonathan"];
```

We want you to build a rest endpoint that will

1. Insert the list of names in the database
2. List all the names in the database
3. Search for a name and returns true or false if exists or not
4. Don't allow duplicated names
5. Create the required unit tests
6. Necessary JavaDoc

We need to have this in a public repository for us to be able to check out the code.

When it's finish just send an email with the repository URL.
